Computational Quantum Mechanics For Materials

Computational Quantum Mechanics for Materials Engineers describes new approaches to the modelling of disordered alloys that combine the most efficient quantum-level theories of random alloys with the most sophisticated numerical techniques to establish a theoretical insight into the electronic structure of complex materials such as stainless steels, Hume-Rothery alloys and silicates. The practical success of these approaches to applications in all of these areas are covered in detail.

Dr Vitos is considered a world expert on the application of the LMTO quantum mechanical method and its application in materials systems, and he is the creator of the new EMTO-CPA method. These methods represent the first useful applications of modern applied quantum mechanics that can be used practically in the industrial world of metallurgy and alloy design to model and create novel materials.

This School will focus on computational tools for both models and ab-initio methods that deal with so-called "quantum materials" whose spectacular properties, ranging from large thermopower, high-temperature superconductors to heavy fermions, topological insulators and colossal magnetoresistance materials, are consequences of the non-trivial quantum mechanical nature of electrons and of their interactions.
