Specially, the modulation of particle size and molecular interactions by ultrasonication process could provide a promising approach and improve the efficiency for dissolution enhancement of a poorly water-soluble drug. Among the formulations, FN3 showed a potential condition for improving CUR dissolution.

Current Topics in Cellular Regulation, Volume 26: Modulation by Molecular Interactions covers various aspects of biochemical regulation that were presented in the International Symposium on the Molecular Basis of Cellular Regulation held at the National Institutes of Health on May 3-5, 1984.

The absence of palmitoylation does not significantly affect the molecular interactions within rhodopsin as a whole, but rather, is localized to molecular interactions at the carboxyl terminal end. The destabilization in the carboxyl terminal region observed in the absence of palmitoylation appears to affect the interactions with transducin and play a role in altered dark adaptation.

Molecular dynamics (MD) simulations offer a powerful complementary approach with sufficient temporal and spatial resolutions to gain atomic-level structural information and energetics on lipid-protein interactions.

Protein-protein interactions (PPI) have become increasingly popular drug targets, with a number of promising compounds currently in clinical trials. Recent research shows, that PPIs can be modulated

in more ways than direct inhibition, where novel non-competitive modes of action promise a solution for the difficult nature of PPI drug discovery.

Traditionally, the modulation of electrostatic interactions in proteins was done by changing the pH or to a lesser degree changing the ionic strength of the solution (8, 9). Such approaches are complicated by the difficulties of predicting the titration properties of individual amino acid residues in the context of ensembles of protein conformations that are sampled during the folding reaction (10).
